Last Time

Complex Types: Simple Content

```
<xsd:simpleType name="size">
  <xsd:restriction base="xsd:string">
    <xsd:enumeration value="small" />
    <xsd:enumeration value="medium" />
    <xsd:enumeration value="large" />
  </xsd:restriction>
</xsd:simpleType>

<xsd:complexType name="jeans">
  <xsd:simpleContent>
    <xsd:extension base="size">
      <xsd:attribute name="sex">
        <xsd:simpleType>
          <xsd:restriction base="xsd:string">
            <xsd:enumeration value="male" />
            <xsd:enumeration value="female" />
          </xsd:restriction>
        </xsd:simpleType>
      </xsd:attribute>
    </xsd:extension>
  </xsd:simpleContent>
</xsd:complexType>
```

Last Time

Complex Types: Element-Only Content

```
<person>
  <firstname>John</firstname>
  <lastname>Smith</lastname>
</person>

<xsd:element name="person">
  <xsd:complexType>
    <xsd:sequence>
      <xsd:element name="firstname" type="xsd:string"/>
      <xsd:element name="lastname" type="xsd:string"/>
    </xsd:sequence>
  </xsd:complexType>
</xsd:element>
```

Last Time

Complex Types: Mixed Content

```
<letter>
Dear Mr.<name>John Smith</name>.
Your order <orderid>1032</orderid>
will be shipped on <shipdate>2001-07-13</shipdate>.
</letter>

<xsd:element name="letter">
  <xsd:complexType mixed="true">
    <xsd:sequence>
      <xsd:element name="name" type="xsd:string"/>
      <xsd:element name="orderid" type="xsd:positiveInteger"/>
      <xsd:element name="shipdate" type="xsd:date"/>
    </xsd:sequence>
  </xsd:complexType>
</xsd:element>
```

Last Time

Complex Types: Empty Content

```
<product prodid="1345" />

<xsd:element name="product">
  <xsd:complexType>
    <xsd:attribute name="prodid" type="xsd:positiveInteger"/>
  </xsd:complexType>
</xsd:element>
```

This Time

Agenda

- Web Services
- RPCs
- SOAP 1.2
- WSDL 1.1
- Axis 1.3

8

Copyright © 2006, David J. Malan <malan@post.harvard.edu>. All Rights Reserved.

Web Services

History

- SOAP in 1998
- XML-RPC
 - Dave Winer of UserLand Software, 1998
 - <http://www.xml-rpc.com/spec>
- SOAP since 1999
 - Based on XML-RPC
 - Version 0.9 released in late 1999 by Microsoft, DevelopMentor, and Dave Winer
 - Version 1.0 followed soon thereafter
 - Version 1.1 submitted as a W3C note May 2000 by DevelopMentor, IBM, Lotus, Microsoft, and UserLand Software
 - IBM and Microsoft release toolkits. IBM donates toolkit to Apache
 - Many vendors implement SOAP

Web Services

Architecture

- The web services architecture is an evolution of existing technologies
 - The Internet enables hosts to communicate and information to be published and retrieved
 - Distributed computing platforms allow programmatic components to communicate
 - XML closes the barriers between platforms and technologies

RPCs

Remote Procedure Calls

- Two pieces of code (client and server) talk over the network, generally using TCP/IP sockets
- The client need not be aware that it is not using a local class
 - Client-side *stub* implements the service interface and takes care of serializing/marshalling the arguments for transmission over the network. The stub makes the network call and hands the response back to the caller
- The remote object (server) need not be aware that it is not called by a local class
 - Server-side *skeleton* handles deserializing/unmarshalling the arguments and calling the local class, sending back the result to the remote client

SOAP 1.2

What

- SOAP (Simple Object Access Protocol) is used to serialize a remote procedure call (RPC) across the network
- Has its roots in distributed computing technologies
 - DCOM
 - CORBA
 - Java RMI

12

Copyright © 2006, David J. Malan <malan@post.harvard.edu>. All Rights Reserved.

SOAP 1.2

What

- SOAP is a lightweight mechanism for exchanging structured and typed information between peers in a decentralized, distributed environment using XML
- SOAP is an XML-based protocol that consists of three parts
 - An envelope that defines a framework for describing what is in a message and how to process it
 - A set of encoding rules for expressing instances of application-defined datatypes (*i.e.*, how to serialize data structures)
 - A convention for representing remote procedure calls and responses

13

SOAP 1.2

HTTP Request

```
POST /warehouse/services/Purchasing HTTP/1.0
Content-Type: text/xml; charset=utf-8
Accept: application/soap+xml, application/dime, multipart/related, text/*
User-Agent: Axis/1.3
Host: 127.0.0.1
Cache-Control: no-cache
Pragma: no-cache
SOAPAction: ""
Content-Length: 412

<?xml version="1.0" encoding="UTF-8">
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
                  xmlns:xsd="http://www.w3.org/2001/XMLSchema"
                  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <soapenv:Body>
    <processPO
      soapenv:encodingStyle="http://schemas.xmlsoap.org/soap/encoding/"
      <arg0 xsi:type="xsd:string">&lt;PO/&gt;</arg0>
    </processPO>
  </soapenv:Body>
</soapenv:Envelope>
```

14

Copyright © 2006, David J. Malan <malan@post.harvard.edu>. All Rights Reserved.

SOAP 1.2

HTTP Response

```
HTTP/1.1 200 OK
Server: Apache-Coyote/1.1
Content-Type: text/xml;charset=utf-8
Date: Wed, 13 Apr 2005 14:09:02 GMT
Connection: close

<?xml version="1.0" encoding="UTF-8"?>
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <soapenv:Body>
    <processPOResponse
      soapenv:encodingStyle="http://schemas.xmlsoap.org/soap/encoding/">
      <processPOReturn xsi:type="xsd:string">&lt;PO-ACK/&gt;</processPOReturn>
    </processPOResponse>
  </soapenv:Body>
</soapenv:Envelope>
```

15

Copyright © 2006, David J. Malan <malan@post.harvard.edu>. All Rights Reserved.

SOAP 1.2

Envelope

- **Envelope** is the top-level element. It defines the various namespaces used in the message
 - **Header** is an optional element used for carrying extra information about authentication, transactions, *etc.*
 - **Body** is the element containing the payload of the message

16

Copyright © 2006, David J. Malan <malan@post.harvard.edu>. All Rights Reserved.

SOAP 1.2

Encoding Rules

- The SOAP specification describes how to serialize application-specific data-types into and out of an XML representation
 - XML Schema primitive types (`int`, `byte`, `short`, `boolean`, `string`, `float`, `double`, `date`, `time`, and `URL`) are sent as-is
 - More complicated objects (*e.g.*, Java classes) must have a matching schema and a mechanism for serializing into/out of schema

SOAP 1.2

SOAP Router

- A SOAP router
 - Listens on the appropriate protocol
 - Receives SOAP request
 - Has a binding between service's URN and implementing class
 - Calls appropriate class to handle request
 - Returns response to sender
- Apache provides a SOAP router called "Axis" that is an HTTP servlet that can be deployed in any webserver or servlet container

WSDL 1.1

What

- WSDL (Web Services Description Language) describes
 - what a web service can do
 - where it resides
 - how to invoke it
- WSDL is usually used with SOAP as a transport protocol, although it can work with other protocols as well

19

Copyright © 2006, David J. Malan <malan@post.harvard.edu>. All Rights Reserved.

WSDL 1.1

definitions

```
<definitions name="CurrencyExchangeService"
  targetNamespace="http://www.xmethods.net/sd/CurrencyExchangeService.wsdl"
  xmlns:tns="http://www.xmethods.net/sd/CurrencyExchangeService.wsdl"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  xmlns:soap="http://schemas.xmlsoap.org/wsdl/soap"
  xmlns="http://schemas.xmlsoap.org/wsdl/">

  <message name="getRateRequest">...</message>
  <message name="getRateResponse">...</message>

  <portType name="CurrencyExchangePortType">
    ...
  </portType>

  <binding name="CurrencyExchangeBinding" type="CurrencyExchangePortType">
    ...
  </binding>

  <service name="CurrencyExchangeService">
    ...
  </service>
</definitions>
```

what operations does this service provide?

how are those operations invoked?

where is the service?

20

Adapted from <http://www.xmethods.net/sd/2001/CurrencyExchangeService.wsdl>.

Copyright © 2006, David J. Malan <malan@post.harvard.edu>. All Rights Reserved.

WSDL 1.1

message

```
<message name="getRateRequest">
  <part name="country1" type="xsd:string"/>
  <part name="country2" type="xsd:string"/>
</message>
<message name="getRateResponse">
  <part name="return" type="xsd:float"/>
</message>
```

A **message** is a single transmission of information going between the two parties; it has multiple parts that have either simple types (primitives) or more complicated types (defined in a schema)

21

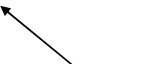

Excerpted from <http://www.xmethods.net/sd/2001/CurrencyExchangeService.wsdl>.

Copyright © 2006, David J. Malan <malan@post.harvard.edu>. All Rights Reserved.

WSDL 1.1

portType

```
<portType name="CurrencyExchangePortType">
  <operation name="getRate">
    <input message="getRateRequest"
      name="tns:getRate"/>
    <output message="getRateResponse"
      name="tns:getRateResponse"/>
  </operation>
</portType>
```

A **portType** corresponds to a set of one or more operations, where each operation defines a specific input/output sequence; corresponds to the programmatic notion of an interface

22

Excerpted from <http://www.xmethods.net/sd/2001/CurrencyExchangeService.wsdl>.

Copyright © 2006, David J. Malan <malan@post.harvard.edu>. All Rights Reserved.

WSDL 1.1

binding

```
<binding name="CurrencyExchangeBinding" type="CurrencyExchangePortType">
  <soap:binding style="rpc"
    transport="http://schemas.xmlsoap.org/soap/http"/>
  <operation name="getRate">
    <soap:operation soapAction=""/>
    <input>
      <soap:body use="encoded"
        namespace="urn:xmethods-CurrencyExchange"
        encodingStyle="http://schemas.xmlsoap.org/soap/encoding"/>
    </input>
    <output>
      <soap:body use="encoded"
        namespace="urn:xmethods-CurrencyExchange"
        encodingStyle="http://schemas.xmlsoap.org/soap/encoding"/>
    </output>
  </operation>
</binding>
```

A **binding** describes how a **portType** is implemented over a particular protocol; the soap message body is created using the type encoding specified by the soap specification. In this case, the protocol is RPC-style SOAP

23

Excerpted from <http://www.xmethods.net/sd/2001/CurrencyExchangeService.wsdl>.

Copyright © 2006, David J. Malan <malan@post.harvard.edu>. All Rights Reserved.

WSDL 1.1

service

```
<service name="CurrencyExchangeService">

  <documentation>Returns the exchange rate between the two
    currencies</documentation>

  <port name="CurrencyExchangePort"
    binding="tns:CurrencyExchangeBinding">
    <soap:address
      location="http://services.xmethods.net:80/soap"/>
    </port>
  </service>
```

A **service** is a collection of related endpoints, described by **documentation**; a **port** describes the availability of a particular binding at an endpoint

24

Excerpted from <http://www.xmethods.net/sd/2001/CurrencyExchangeService.wsdl>.

Copyright © 2006, David J. Malan <malan@post.harvard.edu>. All Rights Reserved.

WSDL 1.1

types

- When a WSDL document declares operations that take more complicated types, XML Schema type definitions are included beneath the WSDL document's **definitions** element

```
<types>
  <xsd:schema targetNamespace="urn:AddressFetcher2"
    xmlns:xsd="http://www.w3.org/1999/XMLSchema">
    <xsd:simpleType name="stateType">
      <xsd:restriction base="xsd:string">
        <xsd:enumeration value="TX"/>
        <xsd:enumeration value="IN"/>
        <xsd:enumeration value="OH"/>
      </xsd:restriction>
    </xsd:simpleType>
    ...
  </types>
```

25

Example excerpted from <http://www.fas.harvard.edu/~cscie259/distribution/lectures/11/examples11/AddressBook/AddressBook.wsdl>.

Copyright © 2006, David J. Malan <malan@post.harvard.edu>. All Rights Reserved.

WSDL 1.1

Document Style

- Web service designers/users often think of the XML representation merely as the "wire format"
- They want RPC-style invocation, with binding to programmatic objects on both sides via serialization
- But sometimes, we want to just use WSDL/SOAP to send an XML document, without the RPC semantics
- To do this, we specify **<soap:binding style="document">** in the WSDL file

26

Copyright © 2006, David J. Malan <malan@post.harvard.edu>. All Rights Reserved.

WSDL 1.1

Tools

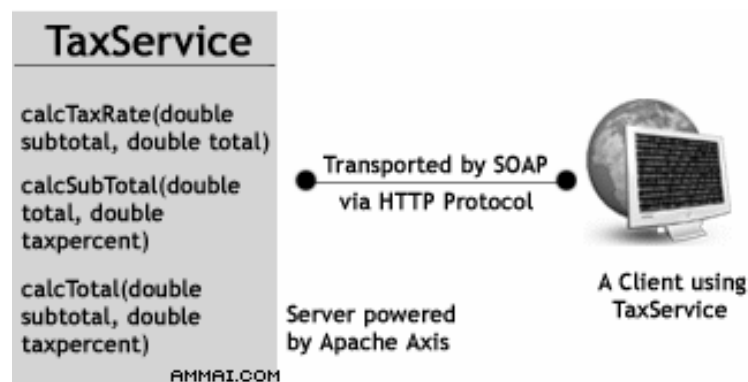

- Toolkits help automate
 - Generating client code from a WSDL file for invoking the web service it describes
 - Generating a WSDL file from an object (Java, COM, Visual Basic class)
